Continuous archiving

iQ.Suite Tips & Tricks for Microsoft Exchange / SMTP

It is a decisive factor in legally compliant email archiving that email is stored in systems in a tamper-proof way. This can be guaranteed by continuous archiving:

Step by Step:

- In legally-compliant email archiving, email is first written to one or more journal mailboxes at SMTP transport level using realtime archiving.
- This email can be archived regularly (for example, every 10 minutes) to the storage system (in iQ.Suite Store 4.1 and later systems), instead of just once a day. This guarantees that cached email in the journal mailboxes is continuously archived.
- To do this, open the mailbox configuration in the iQ.Suite Store Administrator and activate "Enable separate schedule".
Here you can define the time period and intervals for archiving. In this example, email is archived every day between 00:00 and 23:59 in 10-minute intervals.
This function can also be used for multiple mailbox policies.
Please note: This function is available in iQ.Suite Store 4.1 and later systems.
